****RE: Prior Authorization Request for Cardiac MRI with Contrast (CPT 75563)****

****Patient Name:** John Smith**

****Date of Birth:** 1968-03-15**

****Insurance Member ID:** UHC-887612**

Dear Prior Authorization Review Team,

This letter is to formally request prior authorization for a Cardiac MRI with Contrast (CPT code 75563) for our patient, John Smith. This procedure is requested by Dr. Ramesh Kumar, a Board Certified Cardiologist with NPI 1234567890, practicing at City Heart Institute.

Mr. Smith is a 58-year-old male with a documented history of Dilated Cardiomyopathy (ICD-10: I42.0). Despite adherence to Guideline-Directed Medical Therapy (GDMT) for over three years, including Carvedilol, Lisinopril, and Spironolactone, he continues to experience significant symptoms consistent with NYHA Class III heart failure, including worsening shortness of breath and fatigue that interfere with daily activities. A recent echocardiogram performed on January 15, 2026, revealed a severely reduced Left Ventricular Ejection Fraction (LVEF) of 35% with diffuse global hypokinesis and moderate left ventricular dilation. Furthermore, recent

laboratory results from March 10, 2026, show a significantly elevated BNP level of 450 pg/mL, indicative of ongoing heart failure. The Cardiac MRI with Contrast is medically necessary to provide definitive tissue characterization, assess myocardial fibrosis via Late Gadolinium Enhancement (LGE), differentiate between ischemic and non-ischemic cardiomyopathy, and evaluate myocardial viability. These critical findings will directly inform future high-stakes treatment decisions, including the potential candidacy for revascularization or ICD implantation, and will significantly impact the patient's prognosis and management plan.

We appreciate your prompt attention to this request. Please do not hesitate to contact us if you require any further information.

Sincerely,

Dr. Ramesh Kumar MD

NPI: 1234567890

Clinical Summary

Clinical Summary for Prior Authorization Request

1. Diagnosis:

* **ICD-10 Code:** I42.0

* **Description:** Dilated Cardiomyopathy

2. Patient History:

Mr. John Smith is a 58-year-old male with a 3-year history of Dilated Cardiomyopathy (ICD-10: I42.0). He presents with worsening shortness of breath on exertion, persistent fatigue, and reduced exercise tolerance, impacting his activities of daily living. He also reports occasional palpitations. His comorbidities include heart failure with reduced ejection fraction (ICD-10: I50.20).

3. Reason for Procedure:

* **CPT Code:** 75563

* **Description:** Cardiac MRI with contrast

This procedure is requested for definitive tissue characterization, assessment of myocardial fibrosis via Late Gadolinium Enhancement (LGE), differentiation between ischemic and non-ischemic cardiomyopathy, and evaluation of myocardial viability. These findings are critical to guide future treatment decisions, including potential revascularization candidacy and ICD implantation.

4. Supporting Evidence:

* **Echocardiogram (January 15, 2026):** Left Ventricular Ejection Fraction (LVEF) of 35% with diffuse global hypokinesis. The left ventricle is moderately dilated.

* **Laboratory Results (March 10, 2026):**

* BNP: 450 pg/mL (Elevated, consistent with moderate to severe heart failure)

* NT-proBNP: 1850 pg/mL (Elevated)

* Troponin I (High Sensitivity): 0.04 ng/mL (Borderline)

* Metabolic Panel: Normal

* **Clinical Presentation:** New York Heart Association (NYHA) Class III symptoms, shortness of breath at rest and with minimal exertion, orthopnea requiring 3-pillow support, and bilateral lower extremity edema.

* **Prior Treatments Failed:**

- * Guideline-Directed Medical Therapy (GDMT) for over 3 years, including Carvedilol (25mg BID), Lisinopril (10mg daily), and Spironolactone (25mg daily), has not resulted in significant improvement in LVEF or symptoms.
- * Sacubitril/Valsartan was discontinued due to symptomatic hypotension and dizziness.
- * Ivabradine was discontinued due to inadequate heart rate reduction.

5. Clinical Justification:

Cardiac MRI with contrast is indicated for patients with dilated cardiomyopathy and reduced ejection fraction who have persistent symptoms despite optimal medical therapy, as per current cardiology guidelines. The LVEF of 35% and NYHA Class III symptoms despite 3 years of GDMT demonstrate a lack of adequate response to standard treatment. Echocardiography is insufficient for detailed myocardial tissue characterization, making Cardiac MRI with contrast the gold standard for assessing myocardial fibrosis, viability, and differentiating etiologies of cardiomyopathy. This advanced imaging is essential to refine the diagnosis and guide subsequent management strategies, including potential device therapy, aligning with the standard of care for complex heart failure management.

Requirements Checklist

Requirement	Status	Evidence
Confirmed diagnosis of Dilated Cardiomyopathy (ICD-10: I42.0)	✓ MET	Primary ICD-10 code is I42.0 (Dilated Cardiomyopathy) and confirmed in Clinical Justification Note, Physician Order Letter, and Prior Treatment Records.
Symptoms present and documented for a minimum period of 3 months	✓ MET	Clinical Justification Note states '3-year history of Dilated Cardiomyopathy' and 'Current presentation is significant for worsening shortness of breath on exertion, persistent fatigue, and a marked reduction in exercise tolerance'. Prior Treatment Records also confirm '3 years from January 2023 to March 2026'.
Shortness of breath on exertion documented	✓ MET	Clinical Justification Note states 'worsening shortness of breath on exertion' and 'shortness of breath both at rest and upon minimal physical exertion'. Physician Order Letter mentions 'NYHA Class III symptoms'.
Chest pain or pressure documented	✗ MISSING	Chest pain or pressure is not explicitly mentioned in the provided EHR data.
Palpitations or arrhythmia documented	✓ MET	Clinical Justification Note states 'patient reports occasional palpitations'.
Unexplained syncope or near-syncope documented	✗ MISSING	Syncope or near-syncope is not explicitly mentioned in the provided EHR data.
Reduced exercise tolerance documented	✓ MET	Clinical Justification Note states 'marked reduction in exercise tolerance that interferes with activities of daily living' and 'reduced functional capacity' in Prior Treatment Records.
Echocardiogram completed prior to MRI request	✓ MET	Echocardiogram Report is dated January 15, 2026, and the prior authorization request was created on March 18, 2026.
Echocardiogram shows LVEF documented value	✓ MET	Echocardiogram Report documents 'LV Ejection Fraction (LVEF) 35%'.
Echocardiogram shows evidence of wall motion abnormality	✓ MET	Echocardiogram Report states 'Diffuse global hypokinesis noted'.
Echocardiogram shows structural cardiac abnormality requiring further characterization	✓ MET	Echocardiogram Report concludes 'Severely reduced left ventricular systolic function with LVEF of 35%', 'Moderately dilated left ventricle consistent with dilated cardiomyopathy', and 'Recommend Cardiac MRI for further tissue characterization'.
Request ordered by a board-certified Cardiologist or Cardiac Electrophysiologist	✓ MET	Physician ordering the procedure is Dr. Ramesh Kumar, MD, Board Certified Cardiologist, with NPI 1234567890.

Clinical Justification Note submitted	✓ MET	Document 'Clinical Justification Note' uploaded and extracted text is available.
Clinical Justification Note includes patient history	✓ MET	Clinical Justification Note contains a 'PATIENT HISTORY' section detailing the patient's condition and history.
Clinical Justification Note includes current symptoms	✓ MET	Clinical Justification Note contains a 'CURRENT SYMPTOMS' section.
Clinical Justification Note includes previous treatments tried	✓ MET	Clinical Justification Note contains a 'PREVIOUS TREATMENTS TRIED' section.
Clinical Justification Note includes reason echocardiogram is insufficient	✓ MET	Clinical Justification Note contains a 'CLINICAL INSUFFICIENCY OF ECHOCARDIOGRAPHY' section.
Clinical Justification Note is signed and dated	✓ MET	Clinical Justification Note is signed by Dr. Ramesh Kumar MD and dated March 16, 2026.
Echocardiogram Report submitted	✓ MET	Document 'Echocardiogram Report' uploaded and extracted text is available.
Echocardiogram Report within last 12 months	✓ MET	Echocardiogram Report is dated January 15, 2026, which is within 12 months of the current date (March 18, 2026).
Echocardiogram Report documents LVEF value	✓ MET	Echocardiogram Report documents 'LV Ejection Fraction (LVEF) 35%'.
Echocardiogram Report documents chamber dimensions	✓ MET	Echocardiogram Report documents 'LV End Diastolic Diameter 6.2 cm' and 'LV End Systolic Diameter 5.1 cm'.
Echocardiogram Report documents wall motion analysis	✓ MET	Echocardiogram Report documents 'Diffuse global hypokinesis noted'.
Echocardiogram Report documents valve function	✓ MET	Echocardiogram Report documents 'Mitral Valve: Mild mitral regurgitation identified' and 'Tricuspid Valve: Mild tricuspid regurgitation'.
Recent Lab Results submitted	✓ MET	Document 'Recent Lab Results' uploaded and extracted text is available.
Lab Results within last 30 days	✓ MET	Lab Results Report is dated March 10, 2026, which is within 30 days of the current date (March 18, 2026).
BNP or NT-proBNP levels documented	✓ MET	Lab Results Report shows 'BNP (B-type Natriuretic Peptide) 450 pg/mL' and 'NT-proBNP 1850 pg/mL'.
Complete metabolic panel documented	✓ MET	Lab Results Report includes 'SECTION 3 - COMPREHENSIVE METABOLIC PANEL' with results for Sodium, Potassium, Creatinine, eGFR, BUN, Glucose, AST, ALT, and Albumin.

Complete blood count documented	✓ MET	Lab Results Report includes 'SECTION 2 - COMPLETE BLOOD COUNT' with results for WBC, RBC, Hemoglobin, Hematocrit, Platelets, and MCV.
Physician Order Letter submitted	✓ MET	Document 'Physician Order Letter' uploaded and extracted text is available.
Physician Order Letter on physician letterhead	✓ MET	Physician Order Letter is from 'CITY HEART INSTITUTE' and includes contact information.
Physician Order Letter signed by referring Cardiologist	✓ MET	Physician Order Letter is signed by Dr. Ramesh Kumar MD, Board Certified Cardiologist.
Physician Order Letter includes procedure requested	✓ MET	Physician Order Letter states 'PROCEDURE: CARDIAC MRI WITH CONTRAST (CPT 75563)'.
Physician Order Letter includes ICD-10 diagnosis code	✓ MET	Physician Order Letter states 'ICD-10 CODE: I42.0'.
Physician Order Letter includes clinical indication	✓ MET	Physician Order Letter states 'Primary Diagnosis: Dilated Cardiomyopathy (ICD-10: I42.0)' and 'MEDICAL NECESSITY STATEMENT'.
Physician Order Letter includes physician NPI number	✓ MET	Physician Order Letter states 'NPI: 1234567890'.
Prior Treatment Records submitted	✓ MET	Document 'Prior Treatment Records' uploaded and extracted text is available.
Prior Treatment Records documentation of cardiac medications tried for minimum 3 months	✓ MET	Prior Treatment Records cover 'Jan 2023 – Mar 2026' (3 years) and list medications like Carvedilol, Lisinopril, and Spironolactone.
Prior Treatment Records include drug names	✓ MET	Prior Treatment Records list 'Carvedilol', 'Lisinopril', 'Spironolactone', 'Furosemide', 'Sacubitril/Valsartan', and 'Ivabradine'.
Prior Treatment Records include dosages	✓ MET	Prior Treatment Records list dosages such as '25mg', '10mg', '25mg', '40mg', '24/26mg', and '5mg'.
Prior Treatment Records include duration of therapy	✓ MET	Prior Treatment Records specify durations like '3 years', '2y 9mo', and '2 months'.
Prior Treatment Records include patient response or reason for discontinuation	✓ MET	Prior Treatment Records describe responses like 'Partial response — HR controlled but Present symptoms persist' and reasons for discontinuation like 'Discontinued due to symptomatic hypotension and dizziness'.

NPI Number: 1234567890

Date: March 16, 2026

RE: PRIOR AUTHORIZATION REQUEST FOR CARDIAC MRI WITH CONTRAST (CPT 75563)

PATIENT HISTORY

The patient is a 58-year-old male with a documented 3-year history of Dilated Cardiomyopathy (ICD-10: I42.0). Initially diagnosed in January 2023 following a presentation with acute dyspnea, the patient has since exhibited a chronic and progressive clinical course. Current presentation is significant for worsening shortness of breath on exertion, persistent fatigue, and a marked reduction in exercise tolerance that interferes with activities of daily living. Furthermore, the patient reports occasional palpitations, necessitating advanced diagnostic evaluation to assess for structural triggers or arrhythmogenic substrates.

CURRENT SYMPTOMS

At present, the patient exhibits symptoms consistent with New York Heart Association (NYHA) Class III heart failure. Clinical findings include shortness of breath both at rest and upon minimal physical exertion, as well as significant orthopnea requiring 3-pillow support for sleep. Physical examination reveals bilateral lower extremity edema, indicating volume overload. Recent diagnostic monitoring confirms a persistently reduced ejection fraction, signifying a lack of improvement despite standard therapeutic interventions.

PREVIOUS TREATMENTS TRIED

The patient has remained strictly compliant with Guideline-Directed Medical Therapy (GDMT) since diagnosis. The therapeutic regimen includes the following:

- Carvedilol: 25mg twice daily (initiated January 2023)
- Lisinopril: 10mg daily (initiated January 2023)
- Spironolactone: 25mg daily (initiated March 2023)
- Furosemide: 40mg daily for fluid management

Despite adherence to optimal medical therapy for over three years, the patient's symptoms persist and have shown recent signs of progression, suggesting the underlying pathology requires more granular characterization than what is provided by current management tools.

CLINICAL INSUFFICIENCY OF ECHOCARDIOGRAPHY

A transthoracic echocardiogram (TTE) performed in January 2026 documented a Left Ventricular Ejection Fraction (LVEF) of 35% with global hypokinesis. While the TTE provided a baseline assessment of chamber size and function, it is insufficient to fully characterize the myocardial tissue or identify specific fibrosis patterns. Standard echocardiography lacks the resolution required to assess myocardial viability or definitively rule out infiltrative cardiomyopathies. Consequently, a Cardiac MRI with contrast is essential for

definitive tissue characterization and to provide the high-resolution data necessary to guide future high-stakes treatment decisions.

MEDICAL NECESSITY STATEMENT

Cardiac MRI with contrast is medically necessary for this patient to evaluate myocardial fibrosis via Late Gadolinium Enhancement (LGE). This study is critical to assess myocardial viability for potential revascularization candidacy and to differentiate between ischemic and non-ischemic cardiomyopathy. The findings from this advanced imaging will directly impact the clinical treatment plan, influence prognosis, and determine the appropriateness of further interventional therapies.

Respectfully,

Dr. Ramesh Kumar MD
Date Signed: March 16, 2026

License Number: MD-12345-TX

TRANSTHORACIC ECHOCARDIOGRAM REPORT

Ordering Physician:

Dr. Ramesh Kumar MD

Performing Physician:

Dr. Sarah Johnson MD

Facility:

City Heart Institute

Clinical Indication:

Dilated Cardiomyopathy; Follow up evaluation

Study Date:

January 15, 2026

Report Date:

January 15, 2026

Study Type:

Complete TTE

SECTION 1: TECHNICAL QUALITY

Study Quality: Adequate

Windows: Acceptable acoustic windows obtained.

Views: Parasternal long axis, short axis, apical 4-chamber, 2-chamber, 3-chamber, and subcostal views were successfully obtained and analyzed.

SECTION 2: LEFT VENTRICLE MEASUREMENTS

Measurement	Result	Normal Reference Range
LV End Diastolic Diameter	6.2 cm	Less than 5.5
LV End Systolic Diameter	5.1 cm	Less than 3.9
Interventricular Septum	0.8 cm	0.6 to 1.1
Posterior Wall Thickness	0.8 cm	0.6 to 1.1
LV Ejection Fraction (LVEF)	35%	Greater than 55%
LV Fractional Shortening	18%	25 to 45%

SECTION 3: LEFT VENTRICLE FUNCTION

LVEF: 35% – Severely reduced.

Wall Motion: Diffuse global hypokinesis noted. No regional wall motion abnormalities (RWMA) identified.

Diastolic Function: Grade II diastolic dysfunction (pseudonormal pattern).

LV Size: Moderately dilated left ventricle.

SECTION 4: RIGHT VENTRICLE

RV Size: Normal.

RV Function: Mildly reduced.

TAPSE: 1.6 cm (mildly reduced).

RV Systolic Pressure: Estimated 38 mmHg.

SECTION 5: VALVES

Mitral Valve: Mild mitral regurgitation identified. Etiology appears functional, secondary to LV dilation and annular stretching.

Aortic Valve: Trileaflet, normal opening. No significant stenosis or regurgitation visualized.

Tricuspid Valve: Mild tricuspid regurgitation.

Pulmonic Valve: Normal appearance and function.

SECTION 6: OTHER FINDINGS

Pericardium: Small pericardial effusion noted.

Aorta: Normal aortic root diameter.

IVC: Dilated IVC suggesting elevated right atrial pressure.

SECTION 7: CONCLUSION

1. Severely reduced left ventricular systolic function with LVEF of 35%.
2. Moderately dilated left ventricle consistent with dilated cardiomyopathy.
3. Diffuse global hypokinesis.
4. Mild mitral regurgitation — functional etiology.
5. Grade II diastolic dysfunction.
6. Small pericardial effusion.
7. Recommend Cardiac MRI for further tissue characterization.

Interpreting Physician: Dr. Sarah Johnson MD

Board Certified Echocardiographer

Date: January 15, 2026

Ordering Physician:	Dr. Ramesh Kumar MD	Specimen Type:	Venous Blood
Collection Date:	March 10, 2026	Clinical Indication:	Dilated Cardiomyopathy
Report Date:	March 10, 2026		Cardiac MRI Pre-authorization

SECTION 1 - CARDIAC BIOMARKERS

Test	Result	Unit	Reference Range	Flag
BNP (B-type Natriuretic Peptide)	450	pg/mL	Less than 100	HIGH
NT-proBNP	1850	pg/mL	Less than 125 (age < 75)	HIGH
Troponin I (High Sensitivity)	0.04	ng/mL	Less than 0.04	BORDERLINE

SECTION 2 - COMPLETE BLOOD COUNT

Test	Result	Unit	Reference Range	Flag
WBC	7.2	10^3/uL	4.5 to 11.0	NORMAL
RBC	4.8	10^6/uL	4.5 to 5.9	NORMAL
Hemoglobin	13.8	g/dL	13.5 to 17.5	NORMAL
Hematocrit	41.2	%	41 to 53	NORMAL
Platelets	215	10^3/uL	150 to 400	NORMAL
MCV	88	fL	80 to 100	NORMAL

SECTION 3 - COMPREHENSIVE METABOLIC PANEL

Test	Result	Unit	Reference Range	Flag
Sodium	138	mEq/L	136 to 145	NORMAL
Potassium	4.1	mEq/L	3.5 to 5.1	NORMAL
Creatinine	1.1	mg/dL	0.7 to 1.3	NORMAL
eGFR	72	mL/min	Greater than 60	NORMAL
BUN	18	mg/dL	7 to 20	NORMAL

Test	Result	Unit	Reference Range	Flag
Glucose	95	mg/dL	70 to 100	NORMAL
AST	28	U/L	10 to 40	NORMAL
ALT	22	U/L	7 to 56	NORMAL
Albumin	3.8	g/dL	3.5 to 5.0	NORMAL

SECTION 4 - LIPID PANEL

Test	Result	Unit	Reference Range	Flag
Total Cholesterol	195	mg/dL	Less than 200	NORMAL
LDL	118	mg/dL	Less than 130	NORMAL
HDL	42	mg/dL	Greater than 40	NORMAL
Triglycerides	175	mg/dL	Less than 150	BORDERLINE HIGH

SECTION 5 - INTERPRETATION NOTE

Significantly elevated BNP at 450 pg/mL and NT-proBNP at 1850 pg/mL consistent with moderate to severe heart failure.
Renal function preserved. Electrolytes within normal limits.
Results support ongoing heart failure management and prior authorization for advanced cardiac imaging.

SUBJECT: PRIOR AUTHORIZATION REQUEST

PROCEDURE: CARDIAC MRI WITH CONTRAST (CPT 75563)

ICD-10 CODE: I42.0

REQUESTED PROCEDURE

Name:	Cardiac MRI with Contrast
CPT Code:	75563
Urgency:	Routine — Non Emergency
Facility:	City Heart Institute Radiology
Estimated Date:	Within 30 days of approval

CLINICAL INDICATION

Primary Diagnosis: Dilated Cardiomyopathy (ICD-10: I42.0)

Secondary Diagnosis: Heart Failure with Reduced Ejection Fraction (ICD-10: I50.20)

MEDICAL NECESSITY STATEMENT

This procedure is medically necessary for:

- Tissue characterization of myocardium
- Assessment of myocardial fibrosis via late gadolinium enhancement imaging
- Differentiation of ischemic versus non-ischemic cardiomyopathy
- Assessment of myocardial viability
- Guidance of treatment decisions including consideration of ICD implantation

SUPPORTING CLINICAL INFORMATION

- LVEF 35% on recent echocardiogram
- Elevated BNP 450 pg/mL
- NYHA Class III symptoms
- Optimal medical therapy ongoing
- No contraindications to MRI or gadolinium contrast media

I certify that this procedure is medically necessary and appropriate for this patient. All information provided is accurate and complete to the best of my knowledge.

Dr. Ramesh Kumar MD
Board Certified Cardiologist
Date: March 16, 2026
NPI: 1234567890
Contact: 555-123-4567

Treating Physician:	Dr. Ramesh Kumar MD	Report Date:	March 16, 2026
Facility:	City Heart Institute	Specialty:	Cardiology
Period Covered:	Jan 2023 – Mar 2026	Clinical Indication:	Dilated Cardiomyopathy

This document summarizes the complete cardiac medication history for a patient with confirmed Dilated Cardiomyopathy (ICD-10: I42.0) over a period of 3 years from January 2023 to March 2026. All medications listed below were prescribed and monitored by the treating cardiologist as part of optimal medical therapy for heart failure with reduced ejection fraction.

SECTION 1 - MEDICATION HISTORY TABLE

Medication	Dose/ Freq	Dates	Duration	Response	Status
Carvedilol (Beta Blocker)	25mg Twice daily	Jan 2023 – Present	3 years	Partial response – HR controlled but symptoms persist	CURRENT
Lisinopril (ACE Inhibitor)	10mg Once daily	Jan 2023 – Present	3 years	Partial response – BP controlled but LVEF unchanged	CURRENT
Spirololactone (Aldo. Antagonist)	25mg Once daily	Mar 2023 – Present	2y 9mo	Minimal improvement in symptoms	CURRENT
Furosemide (Loop Diuretic)	40mg Once daily	Mar 2023 – Present	2y 9mo	Adequate fluid control; edema managed	CURRENT
Sacubitril/ Valsartan (ARNI)	24/26mg Twice daily	Sep 2023 – Nov 2023	2 months	Discontinued due to symptomatic hypotension and dizziness	DISCONTINUED
Ivabradine	5mg Twice daily	Jan 2024 – Mar 2024	2 months	Discontinued – inadequate heart rate reduction	DISCONTINUED

SECTION 2 - TREATMENT RESPONSE SUMMARY

Despite 3 years of optimal medical therapy with maximum tolerated doses of guideline directed medical therapy (GDMT) including beta blocker, ACE inhibitor, and aldosterone antagonist, patient continues to exhibit:

- Persistent LVEF of 35%
- NYHA Class III symptoms (marked limitation in activity)
- Elevated BNP levels (refer to lab report dated 03/10/2026)
- Reduced functional capacity

SECTION 3 - CURRENT MEDICATION LIST

- **Carvedilol:** 25mg twice daily
- **Lisinopril:** 10mg once daily
- **Spironolactone:** 25mg once daily
- **Furosemide:** 40mg once daily
- **Aspirin:** 81mg once daily
- **Atorvastatin:** 40mg once daily

Physician Attestation:

I certify that the above medication history is accurate and complete. The patient has received optimal guideline directed medical therapy for a minimum of 3 years with inadequate clinical response. Advanced cardiac imaging (Cardiac MRI) is required to guide further treatment decisions, including viability assessment and potential ICD placement.

Dr. Ramesh Kumar MD
