

AutoAuth - Autonomous Prior Authorization Orchestrator

Problem Statement

Healthcare providers face massive administrative burdens and delays due to manual Prior Authorization (PA) processes. Clinicians spend hours extracting data from EHRs to map against complex, changing payer policies, leading to delayed patient care and high denial rates.

Market Size and Growth

- US Prior Authorization Automation market: \$1.13B (2025)
- Projected to reach \$3.69B by 2033 at ~15% CAGR, driven by hospitals shifting toward AI-driven, zero-touch PA workflows

Business Need/Opportunity

- Manual PA creates revenue leakage through avoidable denials and rework on high-cost claims.
- Administrative workload is exploding, forcing hospitals to hire/reassign staff just to handle PA volume.
- Regulatory pressure is increasing (CMS PA modernization rules + stricter turnaround expectations), making automation urgent.

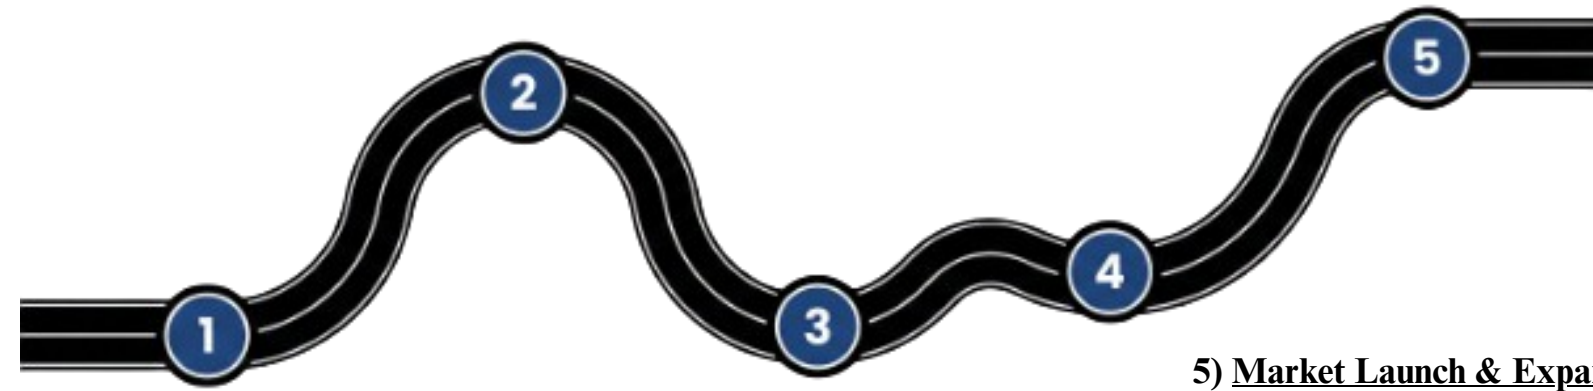

Future Readiness

2) Hackathon PoC (Working Demo)

- Upload patient docs
- Evidence extraction + policy checklist
- Auto-generate PA request packet
- Human review + approve/deny simulation

4) Enterprise Scale & Automation

- Add RFI communication loop + appeal automation
- Peer-to-peer support module
- Multi-hospital + multi-payer scaling
- Audit log + chain of custody

1) Problem Research & Validation

- Study PA pain points + denial reasons.
- Identify key stakeholders (PA coordinators, payers, doctors).
- Define success KPIs (time-to-approval, denial rate)

3) Pilot Integration (Hospital Workflow)

- Connect to EHR using FHIR / SMART
- Add payer policy library (version controlled)
- Support portal/fax/API submission paths

5) Market Launch & Expansion

- Rollout as enterprise PA automation platform
- Continuous policy updates + compliance reporting
- Expand to all PA categories (medical + pharmacy + DME + inpatient)

Target Segment

- **Hospital PA Coordinators / Authorization Teams** (main users)

- **Revenue Cycle / Billing Operations** (submission + tracking)

- **Ordering Physicians / Clinicians** (medical necessity + peer-to-peer)

- **Patients** (faster approvals, fewer care delays)

Solution Details

AutoAuth is an agent-driven Prior Authorization assistant that extracts clinical evidence from EHR documents, matches it to payer rules, generates a complete PA packet, and supports submission, tracking, RFIs, and appeals with final human confirmation.

Proof of Concept

Key Features

- Upload patient docs / EHR intake
- Clinical evidence extraction (diagnosis, procedure, labs, history)
- Policy retrieval + requirement checklist matching
- Auto-generate PA request packet (summary + attachments)
- Submission + payer communication loop (RFI handling)

Advantages

- Reduces administrative workload for PA coordinators by automating evidence extraction and packet preparation
- Improves first-pass approval rate by validating missing documents before submission
- Faster patient care by reducing delays caused by manual PA workflows
- Audit-ready traceability with policy versioning + case history logging
- Scales across PA types (medical + pharmacy + specialty + DME)
